Where each period's topics sit on the topic map

Same layout as the family map; each panel highlights the topics of one period bin over all 6,053 topics of the main network (grey)

Each dot is one of 6,245 topics of the nine period bins (size = posts in its HDBSCAN cluster). A line joins a topic to each of its 5 most similar topics anywhere in the corpus (cosine similarity of the topic embeddings, all-mpnet-base-v2, at least 0.65): 21,964 links, 84 % of them between different bins. Families: Louvain communities; each is named here after its two largest topics. Not drawn: 192 topics outside the main network (isolated, or in small groups linked only to each other); 214 topics of the main network lie beyond the frame (central 98 % of positions).
