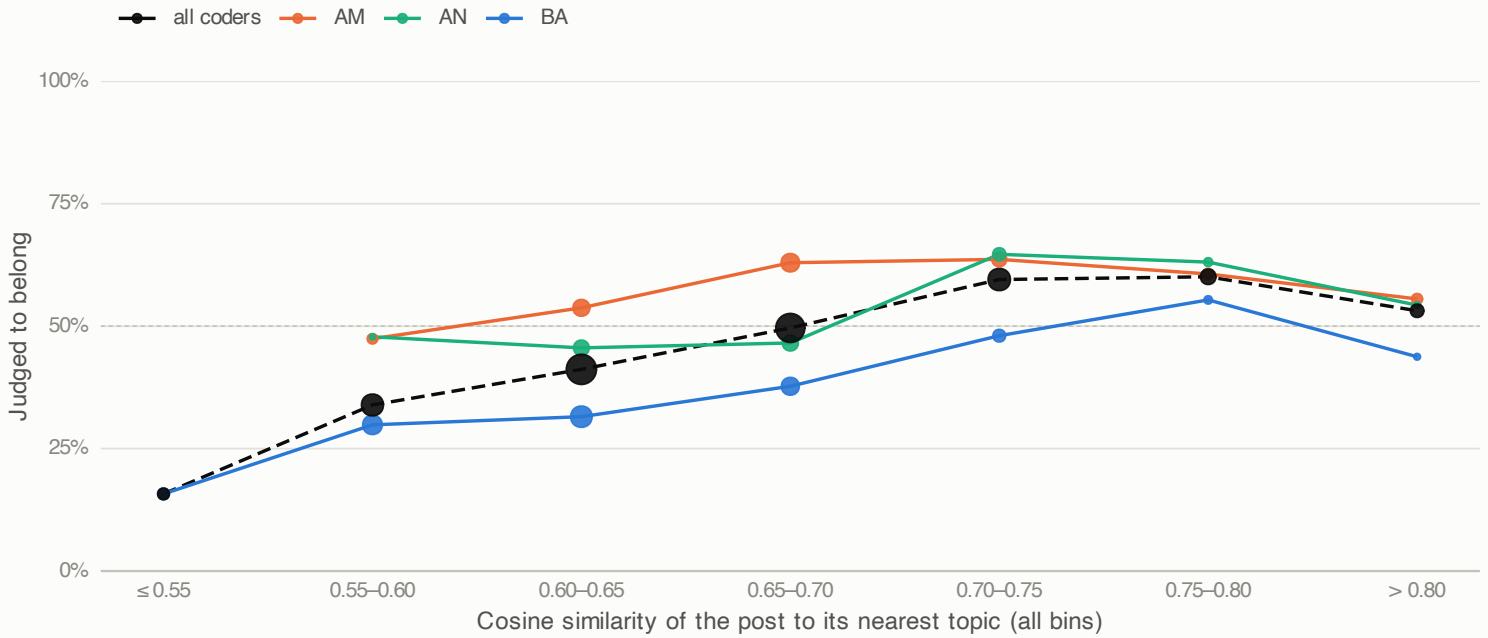
Precision of the admitted posts against their similarity to the nearest topic

Share judged to belong, by band of absolute cosine similarity. One line per coder; the dashed line pools all judgements; point size = judgements in the band.



The bins' cut points differ under the percentile rule (T from 0.497 in bin 1 to 0.616 in bin 8), so the same absolute similarity falls in different tiers in different bins. Precision climbs to about 60 % at a similarity of 0.70 and plateaus. code/15-outlier-calibration.R.
